Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor.

This sequence will be replaced NOTE: This is a 'working draft' sequence. It currently consists of 5 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces

by the finished sequence as soon as it is available and the accession number will be preserved.

 sequence clones from Drosophila Gene Collection I (Rubin et al., Science 2000). The sequence has been subjected to integrity checks for sequence accuracy, presence of a polyA tail and contiguity within 100 kb in the genome. Thus we believe the sequence to reflect accurately this particular cDNA clone. However, there are artifacts associated with the generation of cDNA clones that may have not been detected in our initial analyses such as internal priming, priming from contaminating genomic DNA, retained introns due to reverse transcription of unspliced precursor RNAs, and reverse transcriptase errors that result in single base changes. For further information about this sequence, including its location and relationship to other sequences, please visit our Web site (http://fruitfly.berkeley.edu) or send email to
 cdna@fruitfly.berkeley.edu
 This clone was sequenced as part of a high-throughput process to

 The invention provides a method for identifying or screening a nuclear factor kappa B (NF-kB) activation inhibitor by examining the effect of a test substance on modulating the function(s) of TGF-beta activated kinase 1 (TAKI). The NFKB activation inhibitors targeting on TAKI can be used to treat or prevent autoimmune diseases (e.g. chronic rheumatoid arthritis), intractable diseases with inflammation (such as atrophic dermatitis and psoriasis), viral infection, endotoxin shock, septicemia and others. The present sequence represents the nucleotide sequence of human TAKIC (hTAKIC) protein.
 Nuclear factor kappa for, e.g. autoimmune

 the binding of TAK1 polypeptide to TAB1 polypeptide. The method to comprises: (a) contacting the polypeptide in the presence of a sample; and (b) detecting the amount of bound polypeptide, in which the sample; and (b) detecting the amount of bound polypeptide first. The transforming growth factor (TGF)-beta inhibitory substances can be used in drugs for indications e.g. as TGF-beta signal transmission inhibitors or activators, or extracellular matrix protein production enhancement inhibitors or activators, or cell proliferation prevention inhibitors or activators, or cell proliferation prevention inhibitors or activators, or municosuppression inhibitors or activators, or activators, or activators, or activators, or activators, or activators, or immunosuppression inhibitors or activators, or activators or activators, or precipitation inhibitors or activators, or anyloid beta protein precipitation inhibitors or activators; and such substances can also be inhibitors of the TAK1 polypeptide function, particularly kinase activators.

 TAK-1
 The present sequence encodes human transforming growth factor-beta (TGF-beta) activated kinase, TAK-1. The DNA is used to produce the TAK-1 protein which is involved in the TGF-beta family signal transmission system. TAK-1, also known as activator of MAPK Kinase (AMK-1), is an enzyme which is activated by TGF-beta and bone morphogenetic protein (BMP) and activates MAPK kinase by phosphorylation.

CC the binding of TMAI polypeptide to TMAI polypeptide. The method comprises: (a) contacting the polypeptide in the presence of a sample; cc comprises: (a) contacting the polypeptide in the presence of a sample; cc and (b) detecting the amount of bound polypeptide, in which the sample; cc and be pre-mixed with TMAI or TMAI polypeptide first. The transforming cc growth factor (TGF)-beta inhibitory substances can be used in drugs for indications e.g. as TGF-beta signal transmission inhibitors or cc indications or extracellular matrix protein production enhancement cc inhibitors or activators, or cell proliferation prevention inhibitors or activators, or monocyte migration inhibitors or activators, or monocyte migration inhibitors or activators, or cc immunosuppression inhibitors or activators, or and substances can also be consistent of the TMXI polypeptide function, particularly kinase cc activity. The present sequence encodes human TMXI.

The present invention describes a method for screening compounds for inhibition of inflammatory cytokine signal transduction by contacting the sample with TAK1 and its receptor TAB1 and selecting for inhibition of TAK1/TAB1 binding. Also described is a method for screening compounds for inhibition of inflammatory cytokine signal transduction in which the inhibition of TAK1 phosphorylation is selected for; and drug compositions for the treatment of inflammatory disorders containing as active component an inflammatory cytokine signal transduction inhibitor. TAK1 is an essential component of the signalling process which results in release of inflammatory cytokines such as interleukin. (II-1), inflammatory cytokines such as interleukin. (II-1), for the selection of effective antiinflammatory agents. The present for the selection of effective antiinflammatory agents. The present

The invention relates to identifying pain-regulating substances (A) comprises (i) incubating a test substance with a cell (or preparation from it) that has synthesised a peptide or protein (B) and (ii) measuring either binding of the test substance to (B) or some functional parameter that is altered by this binding. The method is useful for identifying pain-regulating substances (A) with analyssic activity. (A) along with nucleic acid (ABL88411-ABL8841) that encode proteins (B, ABB85005-ABB85037) that interact with (A); (B); vectors containing the nucleic acid; antibodies against (B); cells that express (B) and agents that bind to (B), are all useful for treating pain, particularly chronic pain, including use in gene therapy. The same materials can also be used for diagnosis, e.g. of neurological and neurodegenerative diseases. The present sequence is that of a polynucleotide of the invention.

The invention provides a method for identifying or screening a nuclear factor kappa B (NF-kB) activation inhibitor by examining the effect of a test substance on modulating the function (s) of TGF-beta activated kinase [TAK1]. The NFKB activation inhibitors targeting on TAK1 can be used to treat or prevent autoimmune diseases (e.g. chronic rheumatoid arthritis), intractable diseases with inflammation (such as atrophic dermatitis and psoriasis), viral infection, endotoxin shock, septicemia and others. The present sequence represents the nucleotide sequence of human TAK1a

 The invention provides a method for identifying or screening a nuclear factor kappa B (NF-kB) activation inhibitor by examining the effect of a test substance on modulating the function(s) of TGF-beta activated kinase I (TAKI). The NFkB activation inhibitors targeting on TAKI can be used to treat or prevent autoimmune diseases (e.g. chronic rheumatoid arthritis), intractable diseases with inflammation (such as atrophic dermatitis and psoriaeis), viral infection, endotoxin shock, septicemia and others. The present sequence represents the nucleotide sequence of human TAKIB
 Examples; Page 39-43; 49pp; Japanese.

 TAK-1
 The present sequence encodes mouse transforming growth factor-beta (TGF-beta) activated kinase, TAK-1. The DNA is used to produce the TAK-1 protein which is involved in the TGF-beta family signal transmission system. TAK-1, also known as activator of MAPK Kinase (AMK-1), is an enzyme which is activated by TGF-beta and bone morphogenetic protein (BMP) and activates MAPK kinase by phosphorylation.

 Sequence 3367
 The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences.
 discloses genomic DNA sequences (Asequences (ABL01840-ABL16175) and
 capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in lucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511).

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention suseful in developmental biology and in alucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention sequences (ABL01840-ABL16175) and the encoded proteins
 The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
 New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell

he present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. M1 can be used for screening an anti-neoplastic agent, and can be used for producing a product which

 expression by rectifying mutations or deletions in a patient's genome that affect the activity of PKIN by expressing inactive proteins or to supplement the patients own production of PKIN PKIN nucleic acids may used to produce the PKIN polypeptide, by inserting the nucleic acids in a host cell and culturing the cell to express the protein. PKIN nucleic acids in a cid and its complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar nucleic acid sequences in samples and therefore which patients may be in need of restorative therapy. The present sequence is human PKIN-9

encoding such proteins. PKIN sequences of the invention are useful for diagnosing, treating or preventing disorders associated with aberrant expression of PKIN, particularly immune system disorders (e.g. acquired immune deficiency syndrome (AIDS), thymic hypoplasia, Crohn's disease, anaemia, asthma), neurological disorders (e.g. epilepsy, Charcot-Marie-Tooth disease or selzures), cell proliferative disorders (e.g. cancers such as adenocarcinoma, leukaemia, lymphoma, melanoma, myeloma, sarcoma), and developmental disorders (e.g. Down's syndrome). They are also used in gene therapy and protein therapy. The present sequence is a cDNA encoding human PKIN-12 protein.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 The invention provides a method for identifying or screening a nuclear factor kappa B (NF-kB) activation inhibitor by examining the effect of a test substance on modulating the function(s) of TGF-beta activated kinase 1 (TAK1). The NFkB activation inhibitors targeting on TAK1 can be used to treat or prevent autoimmune diseases (e.g. chronic rheumatoid arthritis), intractable diseases with inflammation (such as atrophic dermatitis and psoriasis), viral infection, endotoxin shock, septicemia and others.  The invention provides a method for identifying or screening a nuclear factor kappa B (NF-kB) activation inhibitor by examining the effect of a test substance on modulating the function(s) of TGF-beta activated kinase I (TAK1). The NFkB activation inhibitors targeting on TAK1 can be used to treat or prevent autoimmune diseases (e.g. chronic rheumatoid arthritis), intractable diseases with inflammation (such as attophic dermatitis and psoriasis), viral infection, endotoxin shock, septicemia and others. Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 MEDLINE=96123277; PubMed=8533096;

Yamaguchi K., Shirakabe K., Shibuya H., Irie K., Ohishi I., Ueno N Yamaguchi T., Nishida E., Matsumcto K.; Matsumcto K.; Matsumcto K.; Matsumcto K.; Matsumcto K.; Matsumcto K.; Matsumcto K.; Matsumcto K.; Matsumcto K.; Matsumcto K.; Matsumcto K.; Matsumcto K.; Matsumcto K.; Matsumcto K.; Matsumcton: Can Phosphorytate AND ACTIVATE YET UNDEFINED MAPKKS.

MEDIATOR OF TGF-BETA SIGNAL TRANSDUCTION. STIMULATES NF-KAPPA
 Mus musculus (Mouse).
Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
Mammalia; Eutheria; Rodentia; Sciurognathi; Muridae; Murinae; Mus
 ACTIVATION.
-!- SIMILARITY: BELONGS TO THE SER/THR FAMILY OF PROTEIN KINASES.
MAP KINASE KINASE KINASE SUBFAMILY.
-!- SIMILARITY: IN THE C-TERMINAL SECTION; STRONG, TO C210RF7.
 16-OCT-2001 (Rel. 40, Created)
16-OCT-2001 (Rel. 40, Last sequence update)
16-OCT-2001 (Rel. 40, Last annocation update)
Mitogen-activated protein kinase kinase kinase 7 (EC 2.7.1.-)
(Transforming growth factor-beta-activated kinase 1) (TGF-beta-activated kinase 1).

 ROD 07-AUG-2002
 found
 Eukaryota, Metazoa, Chordata, Craniata, Vertebrata, Euteleostomi,
Mammalia, Eutheria, Rodentia, Sciurognathi, Muridae, Murinae, Mus.
 Clone distribution: MGC clone distribution information can be four through the I.M.A.G.E. Consortium/LINL at: http://image.llnl.gov Series: IRAK Plate: 9 Row: h Column: 9
This clone was selected for full length sequencing because it passed the following selection criteria: Hexamer frequency ORF analysis, GenomeScan gene prediction, Similarity but not identity
 Submitted (27-APR-2001) National Institutes of Health, Mammalian Gene Collection (MGC), Cancer Genomics Office, National Cancer Institute, 31 Center Drive, Room 11A03, Bethesda, MD 20892-2590,

Direct Submission
 Submitted (08-MAR-2002) Whitehead Institute/MIT Center for Genome Research, 320 Charles Street, Cambridge, MA 02141, USA (bases 1 to 135147)
 ------ Genome Center
Center: Whitehead Institute/ MIT Center for Genome Research
 NOTE: This is a 'working draft' sequence. It currently consists of 5 contigs. Gaps between the contigs are represented as runs of N. The order of the pieces is believed to be correct as given, however the sizes of the gaps between them are based on estimates that have provided by the submittor. This sequence will be replaced by the finished sequence as soon as it is available and the accession number will be preserved.
 sum-of-contigs
 Center clone name: 51 G 1
Sequencing vector: Plasmid; n/a; 100% of reads
Sequencing vector: Plasmid; n/a; 100% of reads
Chemistry: Dye-terminator Big Dye; 100% of reads
Assembly program: Phrap; version 0.960731
Consensus quality: 133686 bases at least Q40
Consensus quality: 134318 bases at least Q20
consensus quality: 134477 bases at least Q20
 Insert size: 151000; agarose-fp
Insert size: 134747; sum-of-contigs
Quality coverage: 11.0 in Q20 bases; agarose-fp
Quality coverage: 12.3 in Q20 bases; sum-of-cont

Sequence Summired by:

Berkeley Drosophila Genome Project
Lawrence Berkeley National Laboratory
Berkeley Drosophila Genome Project
Lawrence Berkeley National Laboratory
Berkeley CA 94720

This clone was sequenced as part of a high-throughput process to
Science 2000). The sequence has been subjected to inceprity checks
for sequence accuracy, presence of a polyA tail and contiguity
within 100 kb in the genome. Thus we believe the sequence to
reflect accurachly this particular cDMA clone. However, there are
artifacts associated with the generation of CDNA clones that may
have not been detected in our initial analyses such as internal
priming, priming from contaminating genomic DNA, retained introns
due to reverse transcription of unspliced precursor RNAs, and
reverse transcriptions that result in single base changes.
For further information about this sequence, including its location
and relationship to other sequences, please visit our Web site
(http://fruitfly.berkeley.edu) or send email to
 / translations.rgynorzelynorze

 The invention provides a method for identifying or screening a nuclear factor kappa B (NF-kB) activation inhibitor by examining the effect of a test substance on modulating the function(s) of TGF-beta activated kinase I (TAKI). The NFkB activation inhibitors targeting on TAKI can be used to treat or prevent autoimmune diseases (e.g. chronic rheumatoid arthritis), intractable diseases with inflammation (such as atrophic dermatitis and psoriasis), viral infection, endotoxin shock, septicemia and others. The present sequence represents the nucleotide sequence of human TAKIC

 A method has been developed for screening for substances which inhibit the binding of TAKI polypeptide to TABI polypeptide. The method comprises: (a) contacting the polypeptide the presence of a sample; and (b) detecting the amount of bound polypeptide, in which the sample can be pre-mixed with TAKI or TABI polypeptide first. The transforming growth factor (TGF) beta inhibitory substances can be used in drugs for indications e.g. as TGF-beta signal transmission inhibitors or activators, or extracellular matrix protein production enhancement inhibitors or activators, or cell proliferation prevention inhibitors or activators, or monocyte migration inhibitors or activators, or
physiological activity induction inhibitors or activators,

 TAK-1
 The present sequence encodes human transforming growth factor-beta (TGF-beta) activated kinase, TAK-1. The DNA is used to produce the TAK-1 protein which is involved in the TGF-beta family signal transmission system. TAK-1, also known as activator of MAPK Kinase (AMK-1), is an enzyme which is activated by TGF-beta and bone morphogenetic protein (BMP) and activates MAPK kinase by

 inhibition of inflammatory cytokine signal transduction by contacting the sample with TAK1 and its receptor TAB1 and selecting for inhibition of TAK1/TAB1 binding. Also described is a method for screening compounds for inhibition of inflammatory cytokine signal transduction in which the compositions for the treatment of inflammatory disorders containing as active component an inflammatory cytokine signal transduction inhibitor. TAK1 is an essential component of the signalling process which results in release of inflammatory cytokine signal transduction inhibitor. TAK1 is an essential component of the signalling process which results in release of inflammatory cytokines such as interleukin-1 (IL-1), IL-10, tumour necrosis factor (TMF) and IL-6. The methods can be used for the selection of effective antiinflammatory agents. The present sequence encodes human TAK-1, which is used in the exemplification of the

 RESULT
 The invention relates to identifying pain-regulating substances (A) comprises (i) incubating a test substance with a cell (or preparation from it) that has synthesised a peptide or protein (B) and (ii) measuring either binding of the test substance to (B) or some functional parameter that is altered by this binding. The method is useful for identifying pain-regulating substances (A) with analyseic activity. (A) along with nucleic acid (ABL88411-ABL88441) that encode proteins (B), ABB85006-ABB85037) that interact with (A); (B); vectors containing the nucleic acid; antibodies against (B); cells that express (B) and agents that bind to (B), are all useful for treating pain, particularly chronic pain, including use in gene therapy. The same materials can also be used for diagnosis, e.g. of neurological and neurodegenerative diseases. The present sequence is that of a polynucleotide of the invention.
 Identifying pain-regulating and for diagnosis, by measur peptides and proteins -

 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention signalchoses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
 The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABLIG175) and the encoded proteins
 genes

 RESULT 13
```

```
The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 847 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. M1 can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the chemical structure and/or properties of the agent. M1 can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, decondance adenocarcinoma, carcinoma, clear cell cancer, infiltrating ductal cancer, adenocarcinoma, carcinoma, clear cell cancer infiltrating lobular cancer, squamous cell cancer infiltrating lobular cancer, squamous cell cancer on percendentine

Patent No. US20020155624A1

GENERAL INFORMATION:

APPLICANT: OHTOMO, TOSHHILKO

APPLICANT: OHTOMO, TOSHHILKO

APPLICANT: OHTOMO, TOSHHILKO

APPLICANT: OHTOMO, TOSHHILKO

APPLICANT: OHTOMO, TOSHHILKO

APPLICANT: OHTOMO, TOSHHILKO

APPLICANT: OHTOMO, TOSHHILKO

APPLICANT: OHTOMO, TOSHHILKO

FILE REFERENCE: 053466/0278

CURRENT APPLICATION NUMBER: US/09/529,279

PRIOR APPLICATION NUMBER: US/09/529,279

PRIOR APPLICATION NUMBER: PCT/JP98/04796

PRIOR FILING DATE: 1998-10-22

PRIOR FILING DATE: 1998-10-22

PRIOR FILING DATE: 1998-10-22

NUMBER OF SEQ ID NOS: 48

SOFTWARE: Patentin Ver. 2.1

 transforming growth factor-beta receptor signal transduction pathway, which activates TAK-1 kinase activity upon binding. Its amino acid sequence was deduced from a CDNA clone (see AAT91175) obtained from a kidney library; a variant TABB1 (see AAW26707) has Arg rather than Ser at amino acid position 52. Also claimed are: isolated DNA encoding a protein modified by a substitution, deletion and/or addition of 1 or more amino acids of the 504-residue TABB1 sequence; (2) DNA which can hybridise with the 1560 by TABB1 nucleic acid sequence; (3) isolated DNA encoding a protein comprising amino acids 21-579 or 437-504 of the 504 TABB1 sequence;
 DNA encoding TAK1 binding protein TAB1 - member of transforming growth factor beta receptor signal production pathway, which activates TAK-1 kinase activity upon binding
 WPI; 1997-515318/48
N-PSDB; AAT91175.
 Sequence
 (4) DNA encoding a fusion protein comprising an above protein or polypeptide; (5) expression vector comprising an above DNA; and (6) host cell, preferably a mammalian or yeast cell, transformed by the expression vector. Cells expressing TAB1 and TAK1 can be used to screen for TGF-beta signalling pathway inhibitors by contacting the cells with a test compound, and measuring the TAK1 kinase

 A method has been developed for screening for substances which inhibit the binding of TAKI polypeptide to TABI polypeptide. The method comprises: (a) contacting the polypeptide in the presence of a sample, and (b) detecting the polypeptide in the presence of a sample, and (b) detecting the amount of bound polypeptide, in which the sample can be pre-mixed with TAKI or TABI polypeptide first. The transforming growth factor (TGF)-beta inhibitory substances can be used in drugs for indications e.g. as TGF-beta signal transmission inhibitors or activators, or extracellular matrix protein production enhancement inhibitors or activators, or cell proliferation prevention inhibitors cativators, or monocyte migration inhibitors or activators, or
 physiological activity induction inhibitors or activators, or immunosuppression inhibitors or activators, or amyloid beta protein precipitation inhibitors or activators, and such substances can also inhibitors of the TAK1 polypeptide function, particularly kinase
 Screening for TGF- beta inhibitory substances, which are useful drugs for treatment of diseases relating to its disorder % \left(1\right) =\left\{ 1\right\}

 The present invention describes a method for screening compounds for inhibition of inflammatory cytokine signal transduction by contacting the sample with TakI and its receptor TaBI and selecting for inhibition of TaKI/TABI binding. Also described is a method for screening compounds for inhibition of inflammatory cytokine signal transduction in which the inhibition of TAKI phosphorylation is selected for; and drug compositions for the treatment of inflammatory disorders containing as active component an inflammatory disorders containing as active component an inflammatory quokine signal transduction inhibitor. TAKI is an essential component of the signalling process which results in release of inflammatory quokine such as interleukin-1 (IL-1), for the selection of effective antiinflammatory agents. The present for the selection of effective antiinflammatory agents. The present the content of the signal in the exemplification of

 The invention relates to a method for screening a substance inhibiting the formation of a complex between XIAP and TABI, in which X-linked inhibitor of apoptosis protein (XIAP), transforming growth factor-beta activated kinase 1(TAKI) binding protein 1(TABI) and a substance to be tested are contacted with each other and then the presence or formation of a complex between XIAP and TABI is detected. The substance can be used as a drug for extracellular matrix protein production enhancement, cell growth inhibition, monocyte migration, physiologically active substance induction, immunosuppression, and beta-amyloid protein deposition. A substance inhibiting the formation of a complex between TABI and XIAP as as a drug of the substance of the substan

 The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human breast and Br 474 cells. The method involves contracting the probes with a collection of detectably labelled nucleic acids derived from mRNA of human breast, and then measuring the label bound to each probe of the microarray. The probes are useful for verifying the expression of regions of genomic DNA predicted to encode proteins. They are useful for gene discovery, and for encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast disease. Gene expression analysis is useful for assessing the toxicity of chemical agents on cells. The microarray of this invention presents a far greater capture to probe for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The present sequence is a peptide encoded by a single exon nucleic acid

 The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart (see ABA21355-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

(SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably
 cervical cancer.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
 The present invention relates to single exon nucleic acid probes (SENP: see AA131315-AA157546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
 Peptide #809 encoded by probe for measuring placental gene expression.

Clone distribution: MGC clone distribution information can be for through the I.M.A.G.E. Consortum/LinL at: http://image.llnl.gov Series: IRAK Plate: 45 Row: k Column: 11
This clone was selected for full length sequencing because it passed the following selection criteria: Hexamer frequency ORF analysis, GenomeScan gene prediction.

 This sequence was generated from part of bacterial clone contigs of human chromosome 22, constructed by the Sanger Centre Chromosome 22 Mapping Group. Further information can be found at http://www.sanger.ac.uk/HGP/Chr22 During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.
 IMPORTANT: This sequence is not the entire insert of clone RR93-407F17 It may be shorter because we only sequence overlapping sections once, or longer because we arrange for a small overlap between neighbouring submissions.

The true left end of clone RR93-407F17 is at 1 in this sequence. The true left end of clone RR93-407F17 is at 69561 in this sequence. The true right end of clone RR93-333H23 is at 17123 in this sequence. Sequence. The start of this sequence overlaps with sequence
 The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em: BMBL; Sw.; SWISSPROT; Tr., TREMBL; Wp.; WORMPEP; Information on the WORMPEP databaser and be found be found to the WORMPEP databaser. Account from the library RPCI-3 constructed at the Roswell Park Cancer Institute by the group of Pieter de Jong. For further details see WECTOR: pCYPAC2
 HS407F17

Human DNA sequence from clone RP3-407F17 on chromosome 22 Contains the gene for TAB1 (TAK1 binding protein 1), ESTs, STSs, GSSs and two putative CPG islands, complete sequence.
 Submitted (08-DEC-1999) Sanger Centre, Hinxton, Cambridgeshire, Submitted (08-DEC-1999) Sanger Centre, Hinxton, Cambridgeshire, CBIO 18A, UK. E-mail enquirities: humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk
On Jul 10, 1999 this sequence version replaced gi:5419637.
This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is ambiguous, there is an annotation using the 'unsure'
 Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;
Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo.

NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).
NOTE: This is a "working draft' sequence. It currently consists of 59 contigs. The true order of the pieces is not known and their order in this sequence record is
 arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

```
NOTE: This is a 'working draft' sequence. It currently consists of 59 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

 2 (bases 1 to 141498)
Worley, K.C.
Direct Submission
 Unpublished
 NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html).

NOTE: This is a 'working draft' sequence. It currently consists of 60 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence
 as soon as it is available and the accession number will be preserved.
 Center project name: KAAS

Center clone name: CH230-23318

Center clone name: CH220-23318

Sequencing vector: Plasmid;
Chemistry: Dye-terminator Big Dye: 100% of reads
Assembly program: Phrap; version 0.990329

Consensus quality: 86446 bases at least Q40

Consensus quality: 92843 bases at least Q30

Consensus quality: 96514 bases at least Q20

 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 The invention relates to a method for screening a substance inhibiting the formation of a complex between XIAP and TABI, in which X-linked inhibitor of apoptosis protein (XIAP), transforming growth factor-beta activated kinase 1(TAKI) binding protein 1(TABI) and a substance to be tested are contacted with each other and then the presence or formation of a complex between XIAP and TABI is detected. The substance can be used as a drug for extracellular matrix protein production enhancement, cell growth inhibition, monocyte migration, physiologically active substance induction, immunosuppression, and beta-amyloid protein deposition. A substance inhibiting the formation of a complex between TABI and XIAP as well as between XIAP and TGF-beta (Transforming growth factor-beta) type I and/or type II receptor is useful as a drug.

 This cDNA clone codes for human TAB1 (see AAW26706), a novel member of the transforming growth factor-beta receptor signal transduction pathway, which activates TAK-1 kinase activity upon binding. To obtain the full-length TAB1 coding sequence, a human kidney cDNA library was screened using as a probe a partial TAB1 cDNA obtained from a yeast two-hybrid assay for proteins that interacted with TAB1. The 5' terminus was identified by 5'RACE. 2 Different clones were sequenced, with cytosine and adenine (see AAT91178) as the 18ERA BP-5509, respectively, and deposited as FRRM BP-5599 and FERM BP-5509, respectively, and deposited as FRRM BP-5599 and FERM BP-5509, with the 1560 bp nucleic acid sequence; (2) DNA which can hybridise with the 1560 bp nucleic acid sequence; (3) isolated DNA encoding a protein comprising an above protein or polypeptide; (5) expression vector comprising an above DNA, and (6) host cell, preferably a mammalian or yeast cell, transformed by the expression vector. Cells expressing TAB1 and TAK1 can be used to screen for TGF-beta signalling pathway inhibitors by contacting the cells with a test compound, and measuring the TAK1 kinase activity.
 /note= "another clone has adenine at position 185, with codon AGC (Ser) altered to AGA (Arg)"
 DNA encoding TAK1 binding protein TAB1 - member of transforming growth factor beta receptor signal production pathway, which activates TAK-1 kinase activity upon binding

Screening drugs for for TGF- beta inhibitory substances, which are useful treatment of diseases relating to its disorder as

Example 1; Page 143-147; 195pp; Japanese.

A method has been developed for screening for substances which inhibit the binding of TAKI polypeptide to TABI polypeptide. The method comprises: (a) contacting the polypeptide in the presence of a sample; and (b) detecting the amount of bound polypeptide, in which the sample can be pre-mixed with TAKI or TABI polypeptide first. The transforming growth factor (TGF)-beta inhibitory substances can be used in drugs for indications e.g. as TGF-beta signal transmission inhibitors or activators, or extracellular matrix protein production enhancement inhibitors or activators, or cell proliferation prevention inhibitors of activators, or monocyte migration inhibitors or activators, or monocyte migration inhibitors or activators, or monocyte migration inhibitors or activators, or monocyte migration inhibitors or activators, or monocyte migration inhibitors or activators, or monocyte migration inhibitors or activators, or monocyte migration inhibitors or activators, or monocyte migration inhibitors or activators, or monocyte migration inhibitors or activators. physiological activity induction inhibitors or activators, or immunosuppression inhibitors or activators, or amyloid beta protein precipitation inhibitors or activators, and such substances can also inhibitors of the TAKI polypeptide function, particularly kinase activity. The present sequence encodes human TABI. pe b 6

The present invention describes a method for screening compounds for inhibition of inflammatory cytokine signal transduction by contacting the sample with TAK1 and its receptor TAB1 and selecting for inhibition of TAK1 plas described is a method for screening compounds for inhibition of inflammatory cytokine signal transduction in which the inhibition of TAK1 phosphorylation is selected for; and drug compositions for the treatment of inflammatory disorders containing as active component an inflammatory cytokine signal transduction inhibitor. TAK1 is an essential component of the signalling process which results in release of inflammatory cytokines such as interleukin-1 (IL-1), IL-10, tumour necrosis factor (TAF) and IL-6. The methods can be used for the selection of effective antiinflammatory agents. The present

A method has been developed for screening for substances which inhibit the binding of TAKI polypeptide to TABI polypeptide. The method comprises: (a) contacting the polypeptide in the presence of a sample; and (b) detecting the amount of bound polypeptide, in which the sample can be pre-mixed with TAKI or TABI polypeptide first. The transforming growth factor (TGF) beta inhibitory substances can be used in drugs for indications e.g. as TGF-beta signal transmission inhibitors or activators, or extracellular matrix protein production enhancement inhibitors or activators, or monocyte migration inhibitors or activators, or physiological activity induction inhibitors or activators, or myloid beta protein precipitation inhibitors or activators, or amyloid beta protein precipitation inhibitors or activators, and such substances can also be

```

```
This cDNA clone codes for human TAB1 (see AAW26707), a novel member of the transforming growth factor-beta receptor signal transduction pathway, which activates TAK-1 kinase activity upon binding. To obtain the full-length TAB1 coding sequence, a human kidney cDNA library was screened using as a probe a partial TAB1 cDNA obtained from a yeast two-hybrid assay for proteins that interacted with TAK1. The 5' terminus was identified by 5'RACE. 2 Different clones were sequenced, with cytosine (see AAT91175) and adenine as the 185th nucleotide, respectively, and deposited as FERM BP-5599 and FERM BP-508, respectively. Also claimed are: isolated DNA encoding a protein modified by a substitution, deletion and/or addition of 1 or more amino acids of the 504-residue TAB1 sequence; (2) DNA which can hybridise with the 1850 by nucleic acid sequence; (3) isolated DNA encoding a protein or polypeptide; (5) expression or 437-504 of the 504 TAB1 sequence; (4) DNA encoding a fusion vector comprising an above protein or polypeptide; (5) expression vector comprising TAB1 and TAK1 can be used to screen for TGP-beta

 The invention relates to novel genes (ABAll004-ABA21534) and proteins (ABB14678-ABB18001) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone
 Nucleic acids encoding 3224 human nervous system antigen polypeptides, useful for preventing, diagnosing and/or treating nervous system

The invention relates to novel genes (AAL34669-AAL37666) and proteins (ABB03087-ABB04109) associated with the musculoskeletal system useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant)agonists are useful in the diagnosis, treatment and prevention of: (a) cancer of breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, luver, lung, or urogenital; (b) immune consists that the disease, allergies, autoimmune haemolytic anaemia, autoimmune thyroiditis, diabetes mellitus, Crohn's disease, multiple sclerosis, rheumatoid archritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases as cerebral anoxia and epilepsy; and (f) infectious diseases such as viral, bacterial, fungal and Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published\_pct\_sequences. Example 2; SEQ ID NO 3349; 781pp + Sequence Listing; English.

 proteins, called prostate cancer antigens, given in AAB56363 to AAB57302. The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen polynucleotides may be used for detection of prostate cancer, chromosome polynucleotides may be used for detection of prostate cancer, chromosome identification, as chromosome markers, and for numerous other diagnostic or research purposes. The prostate cancer antigens may be used to treat disorders such as neural, immune, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal, and proliferative disorders, wounds, and infectious diseases. AAF16506 to AAF16514 to AAB57303 represent sequences used in the exemplification of the present

 CC nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contacting CC the probes with a collection of detectably labelled nucleic acids CC derived from mRNA of human breast, and then measuring the label CC derived from mRNA of human breast. The probes are useful for CC verifying the expression of regions of genomic DNA predicted to CC encode proteins. They are useful for gene discovery, and for CC expression analysis is useful for assessing the toxicity of chemical CC agents on cells. The microarray of this invention presents a far greater CC diversity of probes for measuring gene expression, with far less bias CC rapid production of functional information from genomic sequence. The cC printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

 The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is one of the probes of the invention.

Seq primer:
 (BMAP)
 This clone was contributed by the Brain Molecular Anatomy Project
 180
/clone lib="NIH BMAP EVO"
/clone lib="NIH BMAP EVO"
/clone lib="NIH BMAP EVO"
/tissue_type="whole brain"
/dev_stage="embryo 15.5 dpc"
/lab_Dsot="DH10B (TI phage resistant)"
/lab_Dsot="DH10B (TI phage resistant)"
/lab_Dsot="Drien" vector: pYX-Asc; Site_1: EcoR I;
Site_2: Not I; The library was constructed according to
Sonaldo, Lennon and Soares, Genome Research, 6:791-806,
1996. Denatured mRNa was size fractionated on a 1% agarose
gel. First strand cDNA synthesis was primed with an
olio-dT primer containing a Not I site. Double stranded
cDNA was size selected according to mRNA size fraction,
ligated with EcoR I adaptor, digested with Not I, and then
cloned directionally into pYX-Asc vector. The library tag
sequence located between the Not I site and the polyA tail
, is GTGCGTGGAA. This library was created for the
University of Iowa Mouse Brain Molecular Anatomy Project
(BMAP): 'Gene Discovery in the Developing Mouse Nervous
System', supported by National Instututes of Mental Health
(NIMH), Hemin Chin, Ph.D., program coordinator."

/note="Organ: brain; Vector: pYX-Asc; Site_1: EcoR I;
Site_2: Not I; The library was constructed according to
Bonaflo, Lennon and Soares, Genome Research, 6:791-806,
1996. Denatured mRNa was size fractionated on a 1% agarose
gel. First strand cDNA synthesis was primed with an
oligo-dT primer containing a Not I site. Double stranded
cDNA was size selected according to mRNA size fraction,
ligated with EcoR I adaptor, digested with Not I, and then
cloned directionally into pYX-Asc vector. The library tag
sequence located between the Not I site and the polyA tail
is GTGCGTGGAA. This library was created for the
University of lowa Mouse Brain Molecular Anatomy Project
(BMAP): 'Gene Discovery' in the Developing Mouse Nervous
System', supported by National Institutes of Mental Health
(NIMH), Hemin Chin, Ph.D., program coordinator."
